Application for the post of Embedded Systems Engineer

Dear Employer,

I have great interest in job vacancy for Embedded Systems Engineer. And find this job position and the related activities for very challenging. I've worked for more than 9 years in the sphere of Embedded Systems design and this is my area of expertise. Most of my professional experience I've been taking positions as Embedded Systems Developer, Embedded firmware and software Engineer. Also as part of a team or independently.

In many of my previous work places and projects I have worked on or have been involved with the design of Embedded Systems. Both hardware and software - from concept to actually realizing the target design, and then from prototype to released product.

My studies in Engineering I have focused on Digital Signal Processing, Industrial and Inner Communication in Embedded Systems. And my strong skills are in the low-level embedded software design: Bare-metal firmware creation, Linux kernel development and similar.

Those areas of mine personal and professional focus I have used through my years working as Embedded Systems Developer and using more extensively with every following project.

I am looking forward to discuss further details in a personal conversation.

Yours sincerely
Dimitar Tomov
